

COURTNEY TRUONG

courtneybtruong@gmail.com • github.com/courtneytruong • linkedin.com/in/courtneybtruong

SUMMARY

Motivated software engineer with hands-on experience building C#/.NET applications. Brings a strong background in quality assurance, detail-oriented work processes, and client-focused communication. Eager to contribute clean, well-tested code to a collaborative engineering team.

SKILLS

Technical: C# • .NET • ASP.NET MVC • Entity Framework • SQL • JavaScript • React • Bootstrap • LangChain • Docker • Github Actions • AWS

Transferable: Critical Thinking • Detail-Oriented • Excellent Communicator • Problem Solver

PROJECTS

TravelMate AI | github.com/courtneytruong/TravelMate-AI

A JavaScript application leveraging LangGraph and RAG architecture with multiple API integrations to answer travel-related queries through a conversational AI interface. Implemented retrieval-augmented generation to ground responses in real travel data, reducing hallucinations and improving response relevance. Integrated multiple external APIs to enrich travel recommendations with up-to-date information on destinations, accommodations, and activities.

EDUCATION & CERTIFICATIONS

Code:You

Generative AI Class - April 2026

React Workshop - April 2025

Software Development Bootcamp | C# & .NET - April 2024

University of the Cumberland

Bachelor of Arts in Biology

Williamsburg, KY

WORK EXPERIENCE

Serco NA 2016 – 2023

Quality Control Clerk 2019 – 2023

Tracked and triaged defects in Jira, writing detailed bug reports and surfacing systemic issues to analysts — directly translating to software QA and issue-tracking workflows used on engineering teams. Executed user acceptance testing (UAT) for new software tool rollouts, identifying and documenting defects prior to release — experience that informs a developer's understanding of the full software delivery lifecycle. Maintained the accuracy of an internal knowledge base used by 100+ representatives, applying data integrity principles analogous to those required in database-driven application development. Contributed to a fully remote, agile-style team with daily standups — familiar with sprint-based workflows, cross-functional collaboration, and iterative delivery practices standard in software development environments.

General Clerk III – Lead 2018 – 2019

Analyzed quality report data for a team of 25 to identify performance gaps and drive targeted process improvements — building an analytical mindset applicable to debugging, code review, and performance optimization. Delivered structured feedback to team members and collaborated with supervisors to implement workflow improvements, demonstrating communication skills critical for code review and cross-functional engineering collaboration.

General Clerk II 2016 – 2018

Applied complex eligibility rules and multi-criteria validation logic to process insurance applications accurately — a structured, rules-based approach closely aligned with writing reliable, condition-driven code. Consistently assigned high-complexity, time-sensitive cases based on demonstrated reliability and process expertise, reflecting a capacity for independent problem-solving under pressure.
